

# DrenchPart

A thoughtful combination of minerals and trace elements  
to support the rapid recovery of downer cows

**Drench Part:**  
a rightful start of lactation – a long-term benefit  
on the cow's performances

Compensation  
of the most common  
primary and secondary  
mineral deficiencies  
affecting lactating cows

Support intakes  
for the ruminal flora  
and the animal's  
metabolism

Trace elements  
favouring a good immune  
and reproductive status  
of the animal

Drench Part is recommended to correct  
electrolytic unbalances after calving:  
-To meet the requirements of the cow in the post-partum period  
-To compensate the electrolytic deficiencies of downer cows.
